In this preclinical study, we analyzed the pharmacokinetics of Y15 in mice plasma, its metabolic stability in mouse and human liver microsomes and toxicity in mice. The pharmacokinetics study in mice demonstrated that, following intraperitoneal administration at 30 mg/kg dose, Y15 was very rapidly absorbed in mice, reaching maximum plasma concentration in 4.8 min. Y15 rapidly metabolized in mouse and human liver microsomes with half-life (t/2 of 6.9 and 11.6 min, respectively.

Objective: The antimicrobial agent flucloxacillin is a potential cause of drug-induced liver disease, but the underlying mechanisms for toxicity have not been fully elucidated. As in-vitro and in-vivo findings suggest that biotransformation products contribute to hepatotoxicity, the purpose of this study was to characterize formation and accumulation of its metabolites in patients with renal ...

The journey from molecular target and early drug lead to the clinic is an arduous one with many hurdles to cross prior to developing a successful clinical candidate. The high rate of attrition of drug molecules has forced drug researchers to pay greater attention to drug metabolism and pharmacokinetics (DMPK) of lead molecules at even the earliest stages of drug discovery. Throughout the ...

Drug Metabolism and Pharmacokinetics - an overview ...

Pharmacokinetics Metabolism Drug metabolism usually involves two types of biochemical reactions - phase I and phase II reactions Phase I reactions: Oxidation, reduction, hydrolysis. Mainly performed by the P450 enzymes but some drugs are metabolised by specific enzymes, for example alcohol dehydrogenase and xanthine oxidase. Products of phase I reactions are typically more active and ...

The study of drug metabolism is called pharmacokinetics. The metabolism of pharmaceutical drugs is an important aspect of pharmacology and medicine. For example, the rate of metabolism determines the duration and intensity of a drug's pharmacologic action. Drug metabolism also affects multidrug resistance in infectious diseases and in chemotherapy for cancer, and the actions of some drugs as substrates or inhibitors of enzymes involved in xenobiotic metabolism are a common reason for ...

Drug metabolism - Wikipedia

Drug metabolism is the process by which the body breaks down and converts medication into active chemical substances. Toxicology is a branch of Medical Science that deals with the effects of chemical compound used in the diagnosis, treatment, or prevention of disease or other abnormal condition on the body.

The study was undertaken to investigate the stereoselective glucuronidation metabolism, pharmacokinetics, anti-amnesic effect and acute toxicity of VAS enantiomers. In results, the glucuronidation metabolic rate of l-VAS was faster than d-VAS in human liver microsomes and isoenzymes tests, and it was proved that the UDP-glucuronosyltransferase ...

Pharmacokinetics/toxicokinetics is "defined as the study of the rates of absorption, distribution, metabolism, and excretion [ADME] of toxic substances or substances under toxicological study" (OECD, n.d.). Pharmacokinetics/toxicokinetics testing involves describing "the bioavailability of a substance and its kinetic and metabolic fate within the body" (Coccke, et al., 2005).

Drug metabolism and pharmacokinetics, or commonly referred to as DMPK, is a scientific discipline within drug discovery, dealing with safety and efficacy evaluation of drug candidates before entering clinical trials. DMPK studies come along with absorption, distribution, metabolism, excretion, and toxicity analysis (ADMET) of drug candidates.

Drug Metabolism and Pharmacokinetics (DMPK)

The discipline of pharmacokinetics has been with us for many years while toxicokinetics is a far more recent discipline. Toxicokinetics are now a necessary and required component of studies. Pharmacokinetic studies require extensive collaboration with pharmacology, clinical pharmacology, and clinical development.
