An IGBT allows the user to actively modulate the motor's speed by adjusting the Volts/Hertz ratio. Therefore, 460/60 is full speed and 230/30 equals half speed, etc. This method of control, however, causes different electrical stresses on a motor, which necessitated further motor innovation and led to the inverter duty

An electrical control system is a physical

interconnection of devices that influences the behaviour of other devices or systems. A simple electronic system is made up of an input, a process, and an output. Both input and output variables to the system are signals. Examples of such systems include circulation pumps, compressors, manufacturing systems, refrigeration plant

Most electric motors operate through the interaction between the motor's magnetic field and electric current in a wire winding to generate force in the form of torque

applied on the motor's shaft. Electric motors can be powered by direct current (DC) sources, such as from batteries, motor vehicles or rectifiers, or by alternating current (AC) sources, such as a power grid, inverters or electrical generators.
